

# BUSINESS LEADERSHIP IN SUSTAINABILITY IMPACT

WSP develops creative, comprehensive and sustainable engineering solutions to uniquely complex problems across sectors and geographies, creating a future where both society and people can thrive. WSP is involved in every stage of a project's life cycle from the business case, through design and construction, to green transition and digital integration.

Through its Future Ready approach, WSP is well positioned to advise, engineer and design sustainability into green and resilient buildings. WSP's greatest impact on sustainability is through its services and advice to clients. One method WSP uses to measure impact is to estimate the percentage of Clean Revenue, defined as revenues earned from services that have a positive impact on the environment and that support the UN SDGs. In 2020, approximately 43% of revenues were earned from various services in WSP's global operations.

WSP also leads by example with its goal of achieving net zero emissions across its value chain by 2040.
